NEWS RELEASE

**Idaho Elks Rehabilitation Hospital
& New “Interactive Metronome” Therapy-
A Revolution in Neurological and Motor Rehab**

Boise, May 14, 2007

The **Interactive Metronome (IM)** is a brain-based rehabilitation assessment and training program developed in the early 1990s that proved to greatly benefit children diagnosed with learning and developmental disorders. Today, after years of clinical studies, the IM therapy is used with great success to treat such diagnoses as stroke, Brain Injury, balance disorders, Parkinson’s Disease, Autism Spectrum Disorder and ADD/ADHD.

This therapy is now available for both inpatient and outpatient needs at the Idaho Elks Rehabilitation Hospital. Trained therapists work with patients of all ages to strengthen motor skills, mobility, gross motor function and many fundamental cognitive capacities such as planning, organizing, and language.

A **FREE** demonstration of this revolutionary new treatment is open to the general public and medical professionals on Saturday May 19, 2007 from 9:00 am to 11:00 am. The Physical Therapy team from the Elks will provide an informative lecture, lots of time for questions and answers, and hands-on practice with the actual audio/visual computer-based models.

IM therapy has been featured on the CBS Early Show, CNN News, US News and World Report, as well as in other regions on local TV and radio.

You are more than welcome to attend the demonstration, contact us regarding patient success stories, or go online for more information at www.interactivemetronome.com.
